

Atom-Type Enrichment of MTO-Associated Contributions

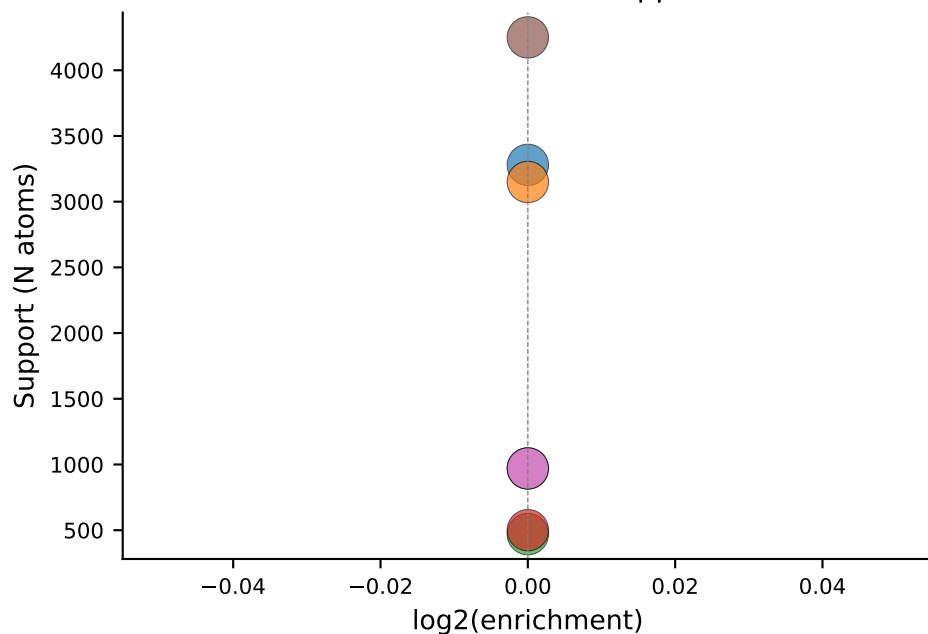

A Atom-Type Enrichment (Good Seeds)

B Enrichment Heatmap

C Enrichment vs Support

D Interpretation

Note: RDKit unavailable – using atom-type enrichment as proxy.

Top enriched atom types (good seeds):

Carbon: 1.00x

Hydrogen: 1.00x

Nitrogen: 1.00x

High-contribution MTO-associated atoms show non-uniform distribution across atom types. This supports preliminary chemical interpretability of MTO response-mode patterns.
