

Good vs Bad Seed Atom-Type Enrichment Comparison

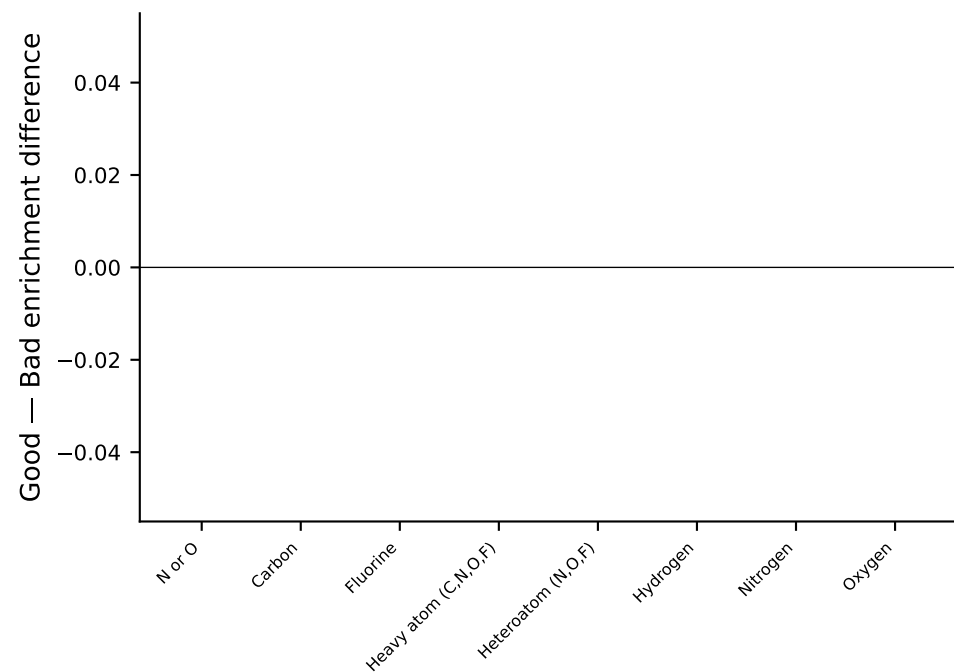

A Good Seeds

B Bad/Worst Seeds

C Enrichment Difference

D Interpretation

Maximum enrichment difference between good and bad seeds: 0.000

Good and bad seeds show broadly similar atom-type enrichment profiles. The performance gap (test MSE: 0.45 vs 0.86-1.08) is not caused by different atom-type usage patterns.

This is preliminary atom-type enrichment evidence only.
