

A Good Seeds Activity

B Bad/Worst Seeds Activity

C Performance vs Similarity

D Interpretation

Good seeds (S1,S3): test MSE ~ 0.46
 Bad/worst (S0,S2,S4): test MSE ~ 0.86 -1.08

MT0 subspaces are moderately similar
 across all seeds ($S_{\text{sub}} \sim 0.51$).

The performance gap likely reflects
 optimization quality (escaping poor
 local minima) rather than qualitatively
 different MT0 response-mode organization.

Preliminary evidence for MT0 response-mode
 stability, with seed-dependent optimization
 gap remaining.
